## AMENDMENTS TO THE CLAIMS:

Please cancel claims 1-15 and 17-18 without prejudice and amend dependent claim 16 to be independent and to read as shown below.

- 1-15. (Canceled)
- 5 16. (Currently Amended) <u>A computer-implemented method for accelerating database query processing, comprising:</u>
  - determining during execution of a particular query whether continued execution of a particular query

    execution plan is worthwhile by
- 10 <u>calculating the amount of query execution remaining:</u>

placing a number of checkpoints in the query execution plan;

optimization parameter values at a given checkpoint to determine the significance of parameter estimation errors, by pushing the checkpoint below a materialization point for subsequent execution. The method of claim 13 further comprising transferring each row to its parent operator in a pipelined manner, storing identifiers of all rows returned on a side table using an INSERT plan operator just below the return operator, then compensating for returned row results by executing an anti join between the side table and a new result stream;

execution remains and significant parameter estimation errors have occurred; and if continued execution is not worthwhile, then suspending query execution, re-optimizing the query, and restarting query execution with a re-optimized query plan.

17-18. (Canceled)
